

The P.I.G. Hog Trap Setup Guide

Portable Interception Gear — From Unboxing to Trap Mode

Kit contents

- Layout / measuring rope (long rope and short rope with carabiner)
- Trap net with integrated rings and convertible cap
- 10 two-piece ground anchors
- 10 T-post brackets
- 10 cinch straps

Tools you need to supply

- 10 T-posts
- Post driver
- Hammer
- Screwdriver
- Impact driver (recommended for anchors)

Step 1 — Inventory the kit and gather tools

Unpack the blue bag and confirm every included part. Lay out the T-posts, post driver, hammer, screwdriver, and impact driver before you start.

Step 2 — Choose and clear the site

Select a flat area with hog activity. Walk a full circle around the intended center and clear brush, limbs, and obstacles so posts and net will sit cleanly.

Step 3 — Mark the center and set the first T-post

Place the inner end of the longest layout rope at the center point and drive a screwdriver into the ground to hold it. Stretch the long rope out and drive the first T-post at the end of that rope. Face the knotted / nub side of the post toward the center.

Step 4 — Install the remaining T-posts

Clip the short rope's carabiner to the back of the first post's center nub. Pull both ropes tight. Drive the next post at the end of the two ropes. Repeat around the circle until all 10 posts are in and spacing is even. Remove the measuring ropes.

Step 5 — Install the ground anchors

Place each anchor about 5 feet outside its matching post. Align each anchor with the post directly across the circle. Drive the anchors securely. Do not bury them so deep that the tops disappear.

Step 6 — Stage the straps

Unwind all 10 straps. Connect each strap from its outer anchor to its T-post, with the buckle near the post. Leave the straps loose.

Step 7 — Deploy the net and hang it on the posts

Remove the net from the bag and stretch it across the circle. Keep caps / rings facing inward. At each post: slide the bottom (midline) ring over the post, install the T-post bracket below the second nub, slide the top ring on, then start the strap. Work around the circle. Tighten straps evenly so the trap holds shape under hog pressure.

Step 8 — Set the convertible cap

If deer pressure is high, feed slack and lay the cap flat. To use the cap, walk the rope around the trap, cinch it over the top, wrap it on a post, and half-hitch it off.

Step 9 — Training mode and baiting

Loosen selected straps and pull the cable / net so the center sits high enough to discourage deer, while the sides stay low enough to brush hogs' backs. Create two main openings they can see through. Scatter bait lightly under the net, mainly in the middle and a little at the openings—only as much as they will eat in a night. Let the sounder feed and relax under the net for one to three nights, or longer if the hogs are shy.

Step 10 — Trap mode

When hogs are feeding calmly inside, convert to trap mode. Loosen the two straps holding the raised openings, take them off those points, bring them back around to the outer anchors, and tighten. Walk the circle, pull the net to the correct angle, and straighten the center ring. Keep cables running clean in the circle. Place bait in the middle. Hogs can enter under the skirt; the set is now in trap mode.
